

Web page designs and functionality:

Goals in making this:

User friendly, and intuitive for paleobotanical work.

Efficient - for user, and for development with limited duplication of processes.

Based on the data and structure already defined by the backend! (i.e. don't make new things!)

Taxonomy: [use standardized format, DwCo; maybe only display what is entered]

Add Comment

1/07/2022

user D. Contreras

Variation in basal vein number is not observed in the Hunky Dunky locality.

1/04/2022

user I. Miller

The number of basal veins may be variable from 3 to 5 in this morphotype. Need to determine if this variation is present within a single site, and consider merging the morphotypes.

1/02/2022

user D. Contreras

OTU similar to [morphotype DN47] from Denver Basin but differs in having 5 basal veins instead of 3.

Search page overview:

private and public search pages are same design

-reached two ways: from Explore on homepage; or from search function in workbench

Explore fossil plants

Search

OTUs | specimens

schemas | collections

Search by name: If the user knows the name of what they are looking for, they can just type it here to quickly access the page for the OTU/specimen/schema/collection.

Display possible parameters to search by, based on what is clicked above. May need scrolling capabilities.

Quick Results viewed here

-data is clickable to make new tabs for further viewing.

e.g., results displayed here is a list of OTUs; then each OTU can be clicked to generate new tab displaying the full OTU page.

If this is selected, then this side of the screen is replaced with the equivalent of the “Choose Output Options” window in PBDB. Once we have the fields finalized, then we can work through what goes here for each type of search..
